

WHY SHOULD YOU FLUSH YOUR POWER STEERING FLUID

At one time or another, most drivers encounter a power steering problem with their vehicle, anything from fluid leaks or noise to stiff steering or hard turning after first starting the car. Normal driving eventually causes your power steering fluid to suffer from heat, friction and electrochemical degradation. The high pressure created when you hold hard turns is especially damaging.

Your power steering fluid, which starts out clear, eventually turns dark with age. Sludge and varnish deposits build up in your power steering system and affect the easy turning and responsive handling you expect from your vehicle.

Our power steering fluid exchanger safely removes varnish and sludge deposits. It is also the best way to remove wear metals that slowly grind away your power steering internal components, including the power steering hoses, pump, rack and pinion and or gear box. Our power steering fluid exchanger thoroughly cleans your vehicles steering system with fresh power steering fluid and conditioners that revitalize seals and o-rings.

It is recommended that power steering fluid be flushed every 30,000 miles. If your vehicles power steering fluid is showing signs of contamination. Do this before it becomes a major expense.
